* Special categories of cited documents :

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
- *Z* document member of the same patent family

(54) Title: METHOD AND DEVICE FOR THE MECHANICAL TRANSMISSION OF FORCE

(54) Bezeichnung: VERFAHREN UND VORRICHTUNG ZUR MECHANISCHEN KRAFTÜBERTRAGUNG

(57) Abstract: The invention relates to a method and a device for transmitting force by means of spring interaction. According to the invention, a plurality of supports (11) are provided for receiving or positioning one or several springs (15), shock absorbers, or similar, each support being disposed on bearing means. Each support is connected to one or several freewheeling means, e.g. freewheel bearings, such that each support is rotatably or movably guided in a single direction about an axis of rotation or along a straight or curved axis of translation. Furthermore, each support is fitted with one or several individual springs, shock absorbers, or similar in a predefined arrangement. A plurality of such supports are positioned at a distance from each other in such a way that a momentum transmitted to a first support is transmitted by said first support to an adjacent second support by means of spring interaction, is transmitted by said second support to the third support that adjoins the second support, etc. An essential characteristic of the invention lies in the fact that virtually the entire momentum is transmitted to the next closest respective

support as a support that has been set in motion is prevented by the freewheeling means from travelling in the reverse direction such that an initial momentum that is transmitted once from an external source of momentum to the mechanical force-transmitting device can be transmitted practically free of loss across long distances similar to a wave. The momentum can be maintained for an extended period of time at low frictional resistance if the path of travel is closed, e.g. in a circle.

Zur Erklärung der Zweibuchstaben-Codes und der anderen Abkürzungen wird auf die Erklärungen ("Guidance Notes on Codes and Abbreviations") am Anfang jeder regulären Ausgabe der PCT-Gazette verwiesen.

(57) **Zusammenfassung:** Die vorliegende Erfindung betrifft ein Verfahren und eine Vorrichtung zur Kraftübertragung mittels Feder-Wechselwirkung. Dabei wird eine Mehrzahl von Supports (11) zur Aufnahme oder Anordnung von einer oder mehreren Federn (15), Stossdämpfern oder dergleichen vorgesehen und jeder Support auf Lagermitteln angeordnet. Jeder Support steht mit einem oder mehreren Freilaufmitteln, z.B. Freilauflagern, in Verbindung, sodass jeder Support um eine Drehachse oder entlang einer geraden oder gekrümmten Translationsachse in nur einer Richtung dreh- resp. beweglich geführt wird. Ausserdem wird jeder Support mit jeweils einem oder mehreren einzelnen Federn, Stossdämpfern oder dergleichen in einer vorbestimmten Anordnung bestückt. Eine Mehrzahl derartiger Supports wird in Abstand so relativ zueinander angeordnet, dass ein auf einen ersten Support übertragener Impuls von diesem ersten Support mittels Federwechselwirkung auf einen benachbarten zweiten Support, von diesem zweiten Support auf den zum zweiten Support benachbarten dritten Support usw. übertragen wird. Wesentlich dabei ist, dass durch den durch die eingesetzten Freilaufmittel verunmöglichten Rücklauf eines in Bewegung gesetzten Supports eine praktisch vollständige Impulsübertragung auf den jeweils nächsten Support bewirkt wird, sodass ein von einem externen Impulsgeber einmal auf die mechanische Kraftübertragungsvorrichtung übertragener Startimpuls ähnlich einer Welle praktisch verlustfrei über grosse Strecken übertragbar ist. Ist die Strecke in sich geschlossen, z.B. ein Kreis, so kann der Impuls bei nur geringem Reibwiderstand über längere Zeit erhalten bleiben.
